

# CONSEIL D'ÉTAT

Manuel d'utilisation de l'application  
Moteur de recherche  
Open Data

### Main Search Component Body:

Recherche avec "expression exacte", AND, OR, +, -, caractère, mot

All of your search terms will be write here. You can search with the single word, multiple words, with or without Boolean operators and unique.

### Unique Number dossier:

102038

You can search a unique decision by typing the unique numero dossier into the main search component body, it will return you the only one search result if it has this decision otherwise it return nothing.

### Single Word:

Let us search for the word **“Corporel”** from the search component. Only those documents return containing the word **“Corporel”** in the “search” field.

Corporel

### More than one word: 1.

#### OR operator:

Corporel OR Jugement

If we want to search for more than one word? Using the same query we just performed, let us search for **“Corporel OR Jugement”**. This returns the same document as before or maybe more because by default, Elasticsearch treats each word in the search query with an OR operator. In our case, the query will match any document, which contains **“Corporel”** OR **“Jugement”**.

## 2. AND operator:

Search bar containing the text: Corporel AND Jugement

If we provide the operator parameter “AND” in between the same query we performed earlier “**Corporel AND Jugement**” with AND operator. It will return only those decisions who have all these search words in each decision.

### Exact Phrase:

Search bar containing the text: "Votre phrase exacte"

You can search your complete unique sentence including the special characters within the text by writing your search terms (Your sentence) in the double quotes. It will return you only those decisions who has your search terms as a complete string otherwise it will return nothing.

### Boolean Operators:

Search bar containing the text: Corporel +Jugement -Comité

By default, all terms are optional, as long as one term matches. A search for **foo bar baz** will find any document that contains one or more of **foo** or **bar** or **baz**. We have already discussed that the default operator is OR, but there are also Boolean operators which can be used in the query string itself to provide more control.

#### 1. Operator “+”:

The preferred operators are (+) which means that the search term must be present in the search results.

#### 2. Operator “-”:

The Operator (-) means that the search term must not be present in the search results.

#### 3. For example: (Quick Brown +Fox -News) states that:

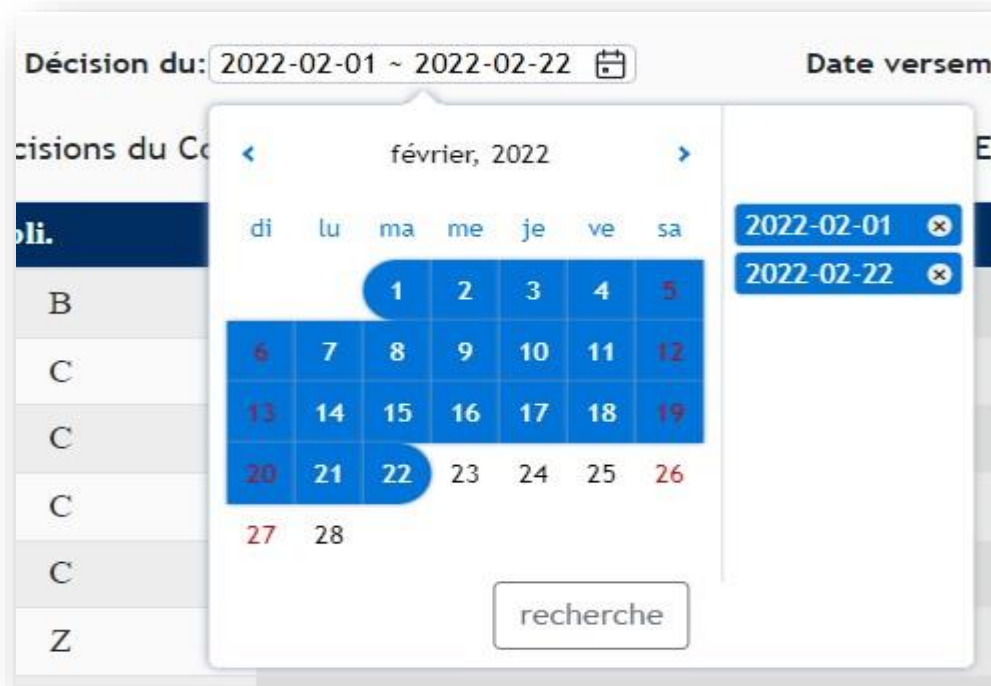

- a. Fox must be present in the search results.
- b. News must to be present in the search results.
- c. Quick and Brown are optional – their presence increase the relevance.

### Search with dates:

You can make a search with the dates by selecting the specific dates from the date search component and click on the recherché button in the date search component. See the example below

## 1. Date ranges:

Pick a starting date from the date search component and pick an end date and hit the recherché button then in return you will have all those search results, which are in between the range of date you have chosen already.

## 2. Greater than a specific date:

Pick a specific date and this time just pick only one date from which you want to see the search results and hit the recherché button, then in return you will have only those search results which is specifically starting from the date you have chosen already.

Décision du: 2022-01-01

Date versement: 2022-01-01

janvier, 2022

di	lu	ma	me	je	ve	sa
						1
2	3	4	5	6	7	8
9	10	11	12	13	14	15
16	17	18	19	20	21	22
23	24	25	26	27	28	29
30	31					

recherche

**Note:** You can make a search for both “**Décision du**” and “**Date versement**” with the same logic as we discuss for the dates, if you pick the dates from the **Décision du** search component you will get the search results specifically just according the **Décision du** dates, and it for the **Date versement**.

Checkboxes:

☐ **Décisions du Conseil d'Etat ?**

You can specifically see the decisions only by marking the “**Décisions du Conseil d'Etat**” and then you will only have the Decisions not the Ordonnances.

You can also search specifically within only the decisions at the same time by marking the **Décisions du Conseil d'Etat** and make a search in the search component and then you will have only decisions in the results. See an example below:

A screenshot of a search interface. At the top, there is a search bar with the word "Corporel" entered and circled in red. Below the search bar, there are two date pickers: "Décision du:" and "Date versement:". Below these, there are three checkboxes: "Décisions du Conseil d'Etat ?" (checked and circled in red), "Ordonnances du Conseil d'Etat ?" (unchecked), and "historique de recherche" (with a circular arrow icon).

Let's make a search by marking the check box for Decisions and make a search with single word "Corporel", it will return only those decisions which have this search term but within only the decisions.

You have the same possibility with the "**Ordonnances du Conseil d'Etat**", and it will just show you the only the Ordonnances, and if you make a search by marking the checkbox it will just return you only the Ordonnances which have this search term. See an example below:

A screenshot of a search interface. At the top, there is a search bar with the word "Corporel" entered and circled in red. Below the search bar, there are two date pickers: "Décision du:" and "Date versement:". Below these, there are three checkboxes: "Décisions du Conseil d'Etat ?" (unchecked), "Ordonnances du Conseil d'Etat ?" (checked and circled in red), and "historique de recherche" (with a circular arrow icon).

Complex Search:

A screenshot of a search bar containing the text: "Corporel AND tribunal -"les 5 juillet et 30 septembre 2021" +"le Conseil d'Etat statuant au contentieux". There is a magnifying glass icon on the left and a close button (X) on the right.

You will get those results, which must have word "**Corporel**", must not the exact phrase "**les 5 juillet et 30 septembre 2021**" but must include "**le Conseil d'Etat statuant au contentieux**" into the search results.

Let's do the same example with AND, NOT, OR operators. Have a look at example below:

A screenshot of a search bar containing the text: "Corporel AND tribunal NOT "les 5 juillet et 30 septembre 2021" OR "le Conseil d'Etat statuant au contentieux". There is a magnifying glass icon on the left and a close button (X) on the right.

You will have the same results as you have previously with the example.
